Mass Email v1.1 Change log

12th October 2024

Added attachment capabilities:

Add attachments to individual emails.
How to use:

Add the absolute/relative path to the file you want to attach to the email against the receiver email in any column. If no attachments are required for any/all emails, no data is needed to be added.

Ex:
 If your application is located in the Downloads folder and your attachment file is located in Downloads>Attachments, add "attachments/yourfile.pdf" as the path in the csv (Recommended)

If your attachment is in located in any other location, add "C:\Users\....\yourfile.pdf" as the path in the csv

NOTE: Make sure to keep the non-attachment data points the same as the number of placeholders. The attachment paths can be at any position in the row but the non-attachment data needs to be in the order that you require them to appear instead of the placeholders.

Changes and bug fixes:

1. Removed .com validation from emails. Emails now can be of the format:
   example@example.example instead of example@example.example
2. Added clearer error message when not passing the required -f data while executing the program
